

**HIGH QUALITY AND PERFORMANCE VACUUM****CHEMICAL COMPATIBILITY GUIDE**

This chemical compatibility guide shows different materials used in various elements of our pump's and rates their chemical resistance to different operating mediums.

It's very important to assure the correct choice of the materials that are part of the pump and remain in direct contact with the medium to pump, because the lifetime of the device and the maintenance are highly dependent of the use that we make and how the application affects to plastic and rubber parts.

The heads of our pumps are generally identified by a letter (N, P or L) that provides information about the head's configuration:

<b>Head configuration</b>	<b>Description</b>
N	The material of the head is PA (Polyamide, Nylon). It is indicated to pump air (polyamides absorb water) and not recommended for pumping gases.
P	The material of the head is PPS (Ryton, Primef). PPS tolerates the pumping of technical gases, steams and condensations. It is a ceramic material that does not absorb humidity.
L	The material of the head is PPS and therefore complies with the same characteristics listed above. This configuration of the head and pump is specific for liquids.

**Diaphragm vacuum pumps**

The following data is based on tests and information provided by our suppliers at ambient temperature and also based on our own research, experience during the years on different fields, etc. Due to the extensive range of application conditions, composition and temperature of the mediums used, this data must only be regarded as a guide. The data is non-binding and must be checked on a case-by-case basis.

The symbols used through the table to rate the chemical effects are as follow:

<b>Symbol</b>	<b>Description</b>
A	Elastomers suffer 0-5% volume swelling. Material shows none to small swelling. Excellent resistance.
B	Elastomers suffer 5-10% volume swelling. Material shows small to moderate swelling. Good resistance.
C	Elastomers suffer 10-20% volume swelling. Material shows moderate to strong swelling. Limited resistance.
D	Material shows severe effects and should not be considered. Not resistant.
E	Information not available.
